Logisim-evolution

We will use circuit simulation software in class and for assignments throughout the term. Logisim runs under Java. If you do not have a **Java Run-time Environment**, you can download/install it from here: JRE .

If you already have a JRE, then download Logisim from here:

- Source Forge Download
- Github Download
- Tutorial

Notice that there is a useful tutorial and reference information under the **help menu**.

If you are having trouble installing or running (especially for those using Mac OS), try downloading the jar, open a terminal, go to the folder with the jar and run it with the following command:

```
java -jar logisim-evolution-3.8.0-all.jar
```

The above command might look different if the version name of the jar file is different.
